

JTree

- Aperçu

- Rôle
 - Afficher une structure arborescente

JTree

Le modèle *TreeModel*

- Structure
 - Object GetRoot() : la racine de l'arbre
 - Object getChild(Object obj, int n) :
 - Retourne le n^{ème} fils de obj
 - Int getChildCount(Object obj) :
 - Retourne le nombre de fils du noeud obj
 - Int getIndexOfChild(Object pere, Object fils)
 - Retourne l'indice du fils
 - Boolean isLeaf(Object obj)
 - Retourne vrai si obj est une feuille
 - Ecouteurs
 - void addTreeModelListener(TreeModelListener l)
 - void removeTreeModelListener(TreeModelListener l)
 - Prise en compte de modifications
 - void valueForPathChanged(TreePath path, Object nouveau)
-
-

JTree

La classe TreePath

- Rôle
 - Représente le chemin amenant à un noeud dans un arbre
 - Constructeurs
 - `TreePath(Object obj)`
 - `TreePath(Object [] obj)`
 - Quelques méthodes
 - `Object getLastPathComponent()`
 - `TreePath getParentPath()`
 - `Object[] getPath()`
 - `Object getPathComponent(int index)`
 - `int getPathCount()`
 - `boolean isDescendant(TreePath descendant)`
 - `TreePath pathByAddingChild(Object obj)`
-
-

JTree

La classe TreeModelListener

- Méthodes
 - Void treeNodesChanged(TreeModelEvent e)
 - Void treeNodesInserted(TreeModelEvent e)
 - Void treeNodesRemoved(TreeModelEvent e)
 - Void treeStructureChanged(TreeModelEvent e)
- Rmq :
 - Mis à part pour treeStructureChanged, les noeuds modifiés doivent avoir un même parent

JTree

La classe TreeModelEvent

- `Object[] getChildren()`
 - Les noeuds fils concernés
- `Int[] getChildIndices()`
 - Les indices des fils concernés
- `TreePath getTreePath()`
 - Chemin du noeud parent des noeuds concernés
- `Object[] getPath()`
 - raccourci de `getTreePath.getPath()`

JTree

Interface TreeNode

- Enumeration children()
 - boolean getAllowsChildren()
 - TreeNode getChildAt(int index)
 - int getChildCount()
 - int getIndex(TreeNode fils)
 - TreeNode getParent()
 - boolean isLeaf()
-
-

JTree

Interface MutableTreeNode (hérite de TreeNode)

- void insert(MutableTreeNode fils, int indice)
 - void remove(int indice)
 - void remove(MutableTreeNode fils)
 - void removeFromParent()
 - void setParent(MutableTreeNode nouveauParent)
 - void setUserObject(Object contenu)
-
-

JTree

La classe *DefaultMutableTreeNode*

- Constructeurs

- `DefaultMutableTreeNode()`
- `DefaultMutableTreeNode(Object contenu)`
- `DefaultMutableTreeNode(Object contenu boolean filsAutorisés)`

- Méthodes

- `Void add(MutableTreeNode fils), void insert(MutableTreeNode fils, int indice)`
 - `Void setParent(MutableTreeNode parent)`. Attention : ne modifie pas les fils du parent
 - `Void remove(int indice), void remove(MutableTreeNode fils)`
 - `Void removeAllChildren(), void removeFromParent()`
 - `Void setUserObject(Object contenu), Object getUserObject(), Object[] getUserObjectPath()`
 - `boolean getAllowsChildren()/void setAllowsChildren()`
 - `int getChildCount(), int getDepth(), int getLevel(), int getLeafCount()`
 - `int getIndex(TreeNode noeud)`
 - `boolean isRoot(), boolean isLeaf(), boolean isNodeChild(TreeNode n), boolean isNodeSibling(TreeNode n), boolean isNodeRelated(DefaultMutableTreeNode n), , boolean isNodeAncestor(TreeNode n), boolean isNodeDescendant(DefaultMutableTreeNode n),`
-
-

JTree

La classe *DefaultMutableTreeNode*

- Méthodes (suite)

- Enumeration `breadthFirstEnumeration()`, Enumeration `depthFirstEnumeration()`, Enumeration `postOrderEnumeration()`, Enumeration `preOrderEnumeration()`
 - Enumeration `children()`
 - `TreeNode getChildAfter(TreeNode fils)`, `TreeNode getChildBefore(TreeNode fils)`, `TreeNode getFirstChild()`, `TreeNode getLastChild()`, `TreeNode getChildAt(int indice)`
 - `DefaultMutableTreeNode getFirstLeaf()`, `DefaultMutableTreeNode getLastLeaf()`
 - `DefaultMutableTreeNode getNextLeaf()/getPreviousLeaf()`, `DefaultMutableTreeNode getNextNode()/getPreviousNode()`, `DefaultMutableTreeNode getNextSibling()/getPreviousSibling()`
 - `TreeNode getSharedAncestor(DefaultMutableTreeNode n)`
 - `TreeNode getParent()`, `TreeNode[] getPath()`, `TreeNode getRoot()`, Enumeration `pathFromAncestorEnumeration(TreeNode ancetre)`
-
-

JTree

La classe *DefaultTreeModel*

- Constructeurs
 - `DefaultTreeModel(TreeNode racine)`
 - `DefaultTreeModel(TreeNode racine, boolean askAllowsChildren)`
- Feuilles d'un arbre
 - Si `askAllowsChildren=true`, feuille ssi noeud déclaré comme n'autorisant pas de fils. Un noeud autorisant des fils mais avec aucun fils ne sera pas considéré comme un noeud feuille

JTree

La classe *DefaultTreeModel*

Méthodes

- void addTreeModelListener(TreeModelListener l), void removeTreeModelListener(TreeModelListener l), TreeModelListener[] getTreeModelListeners()
 - boolean asksAllowsChildren(), void setAsksAllowsChildren(boolean newValue)
 - Object getChild(Object parent, int index), int getChildCount(Object parent), int getIndexofChild(Object parent, Object child)
 - TreeNode[] getPathToRoot(TreeNode aNode)
 - Object getRoot(), void setRoot(TreeNode root)
 - void insertNodeInto(MutableTreeNode newChild, MutableTreeNode parent, int index), void removeNodeFromParent(MutableTreeNode node)
 - boolean isLeaf(Object node)
 - void nodeChanged(TreeNode node), void nodesChanged(TreeNode node, int[] childIndices), void nodeStructureChanged(TreeNode node), void nodesWereInserted(TreeNode node, int[] childIndices), void nodesWereRemoved(TreeNode node, int[] childIndices, Object[] removedChildren)
 - void valueForPathChanged(TreePath path, Object newValue)
 - void reload(), void reload(TreeNode node)
-
-

JTree

La classe JTree : constructeurs

- JTree()
 - JTree(Hashtable<?,?> value)
 - JTree(Object[] value)
 - JTree(TreeModel newModel)
 - JTree(TreeNode root)
 - JTree(TreeNode root, boolean asksAllowsChildren)
 - JTree(Vector<?> value)
-
-

JTree

La classe JTree : la sélection (1)

- Général
 - Void clearSelection()
 - Object getLastSelectedPathComponent()
 - TreeSelectionModel getSelectionModel()
 - Void setSelectionModel(TreeSelectionModel m)
 - Boolean isEmpty()
 - Écouteurs de la sélection
 - Void addTreeSelectionListener(SelectionListener l)
 - Void removeTreeSelectionListener(SelectionListener l)
 - TreeSelectionListener[] getTreeSelectionListeners()
 - Gestion à partir des chemins
 - void addSelectionPath(TreePath chem), void addSelectionPath(TreePath[] chem)
 - void setSelectionPath(TreePath chemin), void setSelectionPaths(TreePath[] chemins)
 - removeSelectionPath(TreePath chemin), removeSelectionPaths(TreePath[] chemins)
 - TreePath getAnchorSelectionPath(), void setAnchorSelectionPath(TreePath chem)
 - TreePath getLeadSelectionPath(), void setLeadSelectionPath(TreePath chemin)
 - TreePath getSelectionPath(), TreePath[] getSelectionPaths()
 - Boolean isPathSelected(TreePath chemin)
-
-

JTree

La classe JTree : la sélection (2)

- Gestion à partir des lignes
 - void addSelectionInterval(int indice0, indice1), setSelectionInterval(int indice0, int indice1), removeSelectionInterval(int indice0, int indice1)
 - void addSelectionRow(int indice), void setSelectionRow(int indice), removeSelectionRow(int indice)
 - void addSelectionRows(int[] indices), void setSelectionRows(int[] indices), removeSelectionRows(int[] indices)
 - int getLeadSelectionRow(), int getMaxSelectionRow(), int getMinSelectionRow(), int[] getSelectionRows()
 - Boolean isRowSelected(int ligne)
 - Conversion lignes/path
 - TreePath getPathForRow(int ligne)
 - int getRowForPath(TreePath path)
-
-

JTree

Options d'affichage

- `TreeCellRenderer getCellRenderer()`
 - `Void setCellRenderer(TreeCellRenderer t)`
 - `Int getRowHeight()`, `void setRowHeight (int h)`, `boolean isFixedRowHeight()`
 - `Boolean getScrollsOnExpand()`, `void setScrollsOnExpand(boolean b)`
 - `Boolean getShowsRootHandles()`, `void setShowsRootHandles(boolean b)`
 - `Boolean isRootVisible()`, `void setRootVisible(boolean b)`
 - `Void setVisibleRowCount (int nb)`, `int getVisibleRowCount()`
-
-

JTree

expansion/compression

- void expandPath(TreePath chemin)
 - void expandRow(int ligne)
 - boolean hasBeenExpanded(TreePath chemin)
 - boolean isCollapsed(int row)
 - boolean isCollapsed(TreePath path)
 - boolean isExpanded(int row)
 - boolean isExpanded(TreePath path)
 - boolean isVisible(TreePath path)
 - void makeVisible(TreePath path)
 - void scrollPathToVisible(TreePath chemin)
 - void scrollRowToVisible(int ligne)
 - void setExpandsSelectedPath(boolean b)
 - void setScrollsOnExpand(boolean b)
 - void setToggleClickCount(int n)
-
-

JTree

Edition

- Void cancelEditing()
- TreeCellEditor getCellEditor()
- TreePath getEditingPath()
- Boolean getInvokesStopCellEditing()
- Boolean isEditable()
- Boolean isEditing()
- Boolean isPathEditable()
- Void setCellEditor(TreeCellEditor t)
- Void setEditable(boolean b)
- Boolean stopEditing()
- Void setInvokesStopCellEditing(boolean b)
- Void startEditingAtPath(TreePath chemin)

JTree

coordonnées

- `TreePath` `getClosestPathForLocation(int x, int y)`
 - `int` `getClosestRowForLocation(int x, int y)`
 - `Rectangle` `getPathBounds(TreePath path)`
 - `Rectangle` `getRowBounds(int row)`
 - `TreePath` `getPathForLocation(int x, int y)`
 - `int` `getRowForLocation(int x, int y)`
-
-

JTree : interface TreeSelectionModel et classe DefaultTreeSelectionModel

- void addPropertyChangeListener(PropertyChangeListener listener), void removePropertyChangeListener(PropertyChangeListener listener)
 - void addTreeSelectionListener(TreeSelectionListener x), void removeTreeSelectionListener(TreeSelectionListener x)
 - void addSelectionPath(TreePath path), void addSelectionPaths(TreePath[] paths)
 - void clearSelection()
 - TreePath getLeadSelectionPath(), int getLeadSelectionRow()
 - int getMaxSelectionRow(), int getMinSelectionRow(), int getSelectionCount()
 - RowMapper getRowMapper(), void setRowMapper(RowMapper newMapper), void resetRowSelection()
 - int getSelectionMode(), void setSelectionMode(int mode) : 3 modes
 - SINGLE_TREE_SELECTION,
 - CONTIGUOUS_TREE_SELECTION
 - DISCONTIGUOUS_TREE_SELECTION.
 - TreePath getSelectionPath(), TreePath[] getSelectionPaths(), int[] getSelectionRows()
 - boolean isPathSelected(TreePath path), boolean isRowSelected(int row)
 - boolean isSelectionEmpty()
 - void removeSelectionPath(TreePath path), void removeSelectionPaths(TreePath[] paths)
 - void setSelectionPath(TreePath path), void setSelectionPaths(TreePath[] paths)
-
-

JTree

Événements de sélection

- Interface `TreeSelectionListener`
 - 1 méthode : `void valueChanged(TreeSelectionEvent e)`
 - Classe `TreeSelectionEvent`
 - `TreePath` `getNewLeadSelectionPath()`
 - `TreePath` `getOldLeadSelectionPath()`
 - `TreePath` `getPath()`
 - `TreePath[]` `getPaths()`
 - `Boolean` `isAddedPath()`
 - `Boolean` `isAddedPath(int indice)`
 - `Boolean` `isAddedPath(TreePath path)`
-
-

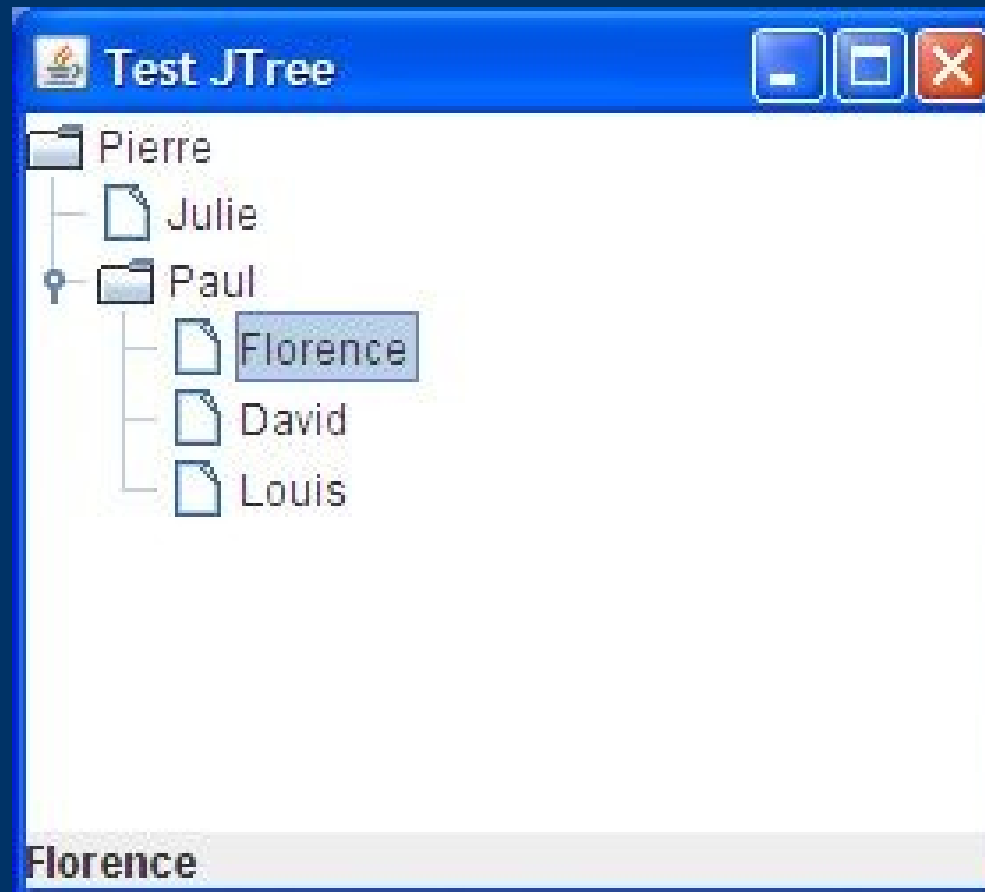

JTree : Événements développement/réduction

- Interface `TreeExpansionListener`
 - `void treeCollapsed(TreeExpansionEvent e)`
 - `void treeExpanded(TreeExpansionEvent e)`
 - Interface `TreeWillExpandListener`
 - `void treeWillCollapse(TreeExpansionEvent e)`
 - `void treeWillExpand(TreeExpansionEvent e)`
 - Classe `TreeExpansionEvent`
 - `TreePath getPath()`
-
-

Exemple de JTree - code

```
public TestJTree() {
    super("Test JTree");
    JPanel panneau = new JPanel(); panneau.setLayout(new BorderLayout()); setContentPane(panneau);
    Jarbre = new JTree(); panneau.add(Jarbre,BorderLayout.CENTER);
    etiquette = new JLabel(" "); panneau.add(etiquette,BorderLayout.SOUTH);
    DefaultMutableTreeNode racine = new DefaultMutableTreeNode("Pierre");
    TreeModel arbre = new DefaultTreeModel(racine); DefaultMutableTreeNode noeudCourant,ancetre;
    anctre = racine; noeudCourant = new DefaultMutableTreeNode("Julie"); anctre.add(noeudCourant);
    noeudCourant = new DefaultMutableTreeNode("Paul"); anctre.add(noeudCourant);
    anctre = noeudCourant; noeudCourant = new DefaultMutableTreeNode("Florence");
    anctre.add(noeudCourant);
    noeudCourant = new DefaultMutableTreeNode("David"); anctre.add(noeudCourant);
    noeudCourant = new DefaultMutableTreeNode("Louis"); anctre.add(noeudCourant);
    Jarbre.setModel(arbre); TreeSelectionModel modeleSelection = new DefaultTreeSelectionModel();
    modeleSelection.setSelectionMode(TreeSelectionModel.SINGLE_TREE_SELECTION);
    Jarbre.setSelectionModel(modeleSelection); Jarbre.addTreeSelectionListener(new gestionSelection());
    pack(); setVisible(true);
}
class gestionSelection implements TreeSelectionListener {
    public void valueChanged(TreeSelectionEvent e) {
        TreeNode noeud = (TreeNode) e.getPath().getLastPathComponent();
        etiquette.setText(noeud.toString());
    }
}
public static void main(String[] args) {
    JFrame fenetre = new TestJTree(); fenetre.setDefaultCloseOperation(EXIT_ON_CLOSE);
}
}}
```

Exemple de JTree - aperçu

JTree : mise à jour après modification d'un noeud

- Pb
 - Un noeud est modifié sans passer par le Jtree
 - Mise à jour de l'affichage ?
- Solution : 2 méthodes au choix
 - Appeler la méthode `updateUI()` sur le Jtree
 - Si le modèle sous-jacent est un `DefaultTreeModel`, appeler sur le modèle `reload(noeudModifié)`

Modification d'un nœud de JTree - code

```
public class TestJTree2 extends JFrame {
    private JTree Jarbre; private DefaultTreeModel arbre; private JTextField etiquette; private JButton valider;
    public TestJTree2() {super("Test JTree"); JPanel panneau = new JPanel(); panneau.setLayout(new BorderLayout());
        setContentPane(panneau); JPanel panneauBas = new JPanel(); Jarbre = new JTree(); Jarbre.setEditable(true);
        etiquette = new JTextField(""); etiquette.setPreferredSize(new Dimension(etiquette.getPreferredSize().width+150,
        etiquette.getPreferredSize().height));
        valider = new JButton("Valider"); valider.addActionListener(new gestionValider());
        panneauBas.add(etiquette); panneauBas.add(valider);
        panneau.add(Jarbre,BorderLayout.CENTER); panneau.add(panneauBas,BorderLayout.SOUTH);
        DefaultMutableTreeNode racine = new DefaultMutableTreeNode("Pierre");
        arbre = new DefaultTreeModel(racine); DefaultMutableTreeNode noeudCourant,ancetre; ancentre = racine;
        noeudCourant = new DefaultMutableTreeNode("Julie"); ancentre.add(noeudCourant);
        noeudCourant = new DefaultMutableTreeNode("Paul"); ancentre.add(noeudCourant);
        ancentre = noeudCourant; noeudCourant = new DefaultMutableTreeNode("Florence"); ancentre.add(noeudCourant);
        noeudCourant = new DefaultMutableTreeNode("David"); ancentre.add(noeudCourant);
        noeudCourant = new DefaultMutableTreeNode("Louis"); ancentre.add(noeudCourant);
        Jarbre.setModel(arbre); TreeSelectionModel modeleSelection = new DefaultTreeSelectionModel();
        modeleSelection.setSelectionMode(TreeSelectionModel.SINGLE_TREE_SELECTION);
        Jarbre.setSelectionModel(modeleSelection); Jarbre.addTreeSelectionListener(new gestionSelection());
        pack(); setVisible(true);}
    class gestionSelection implements TreeSelectionListener { public void valueChanged(TreeSelectionEvent e) {
        TreeNode noeud = (TreeNode) e.getPath().getLastPathComponent(); etiquette.setText(noeud.toString());}}
    class gestionValider implements ActionListener {public void actionPerformed(ActionEvent e) {
        MutableTreeNode noeud = (MutableTreeNode) Jarbre.getSelectionPath().getLastPathComponent();
        noeud.setUserObject(etiquette.getText()); Jarbre.updateUI();}}
    public static void main(String[] args) {JFrame fenetre = new TestJTree2();
        fenetre.setDefaultCloseOperation(EXIT_ON_CLOSE);
    }}
}
```

Modification d'un nœud de JTree aperçu

JTree

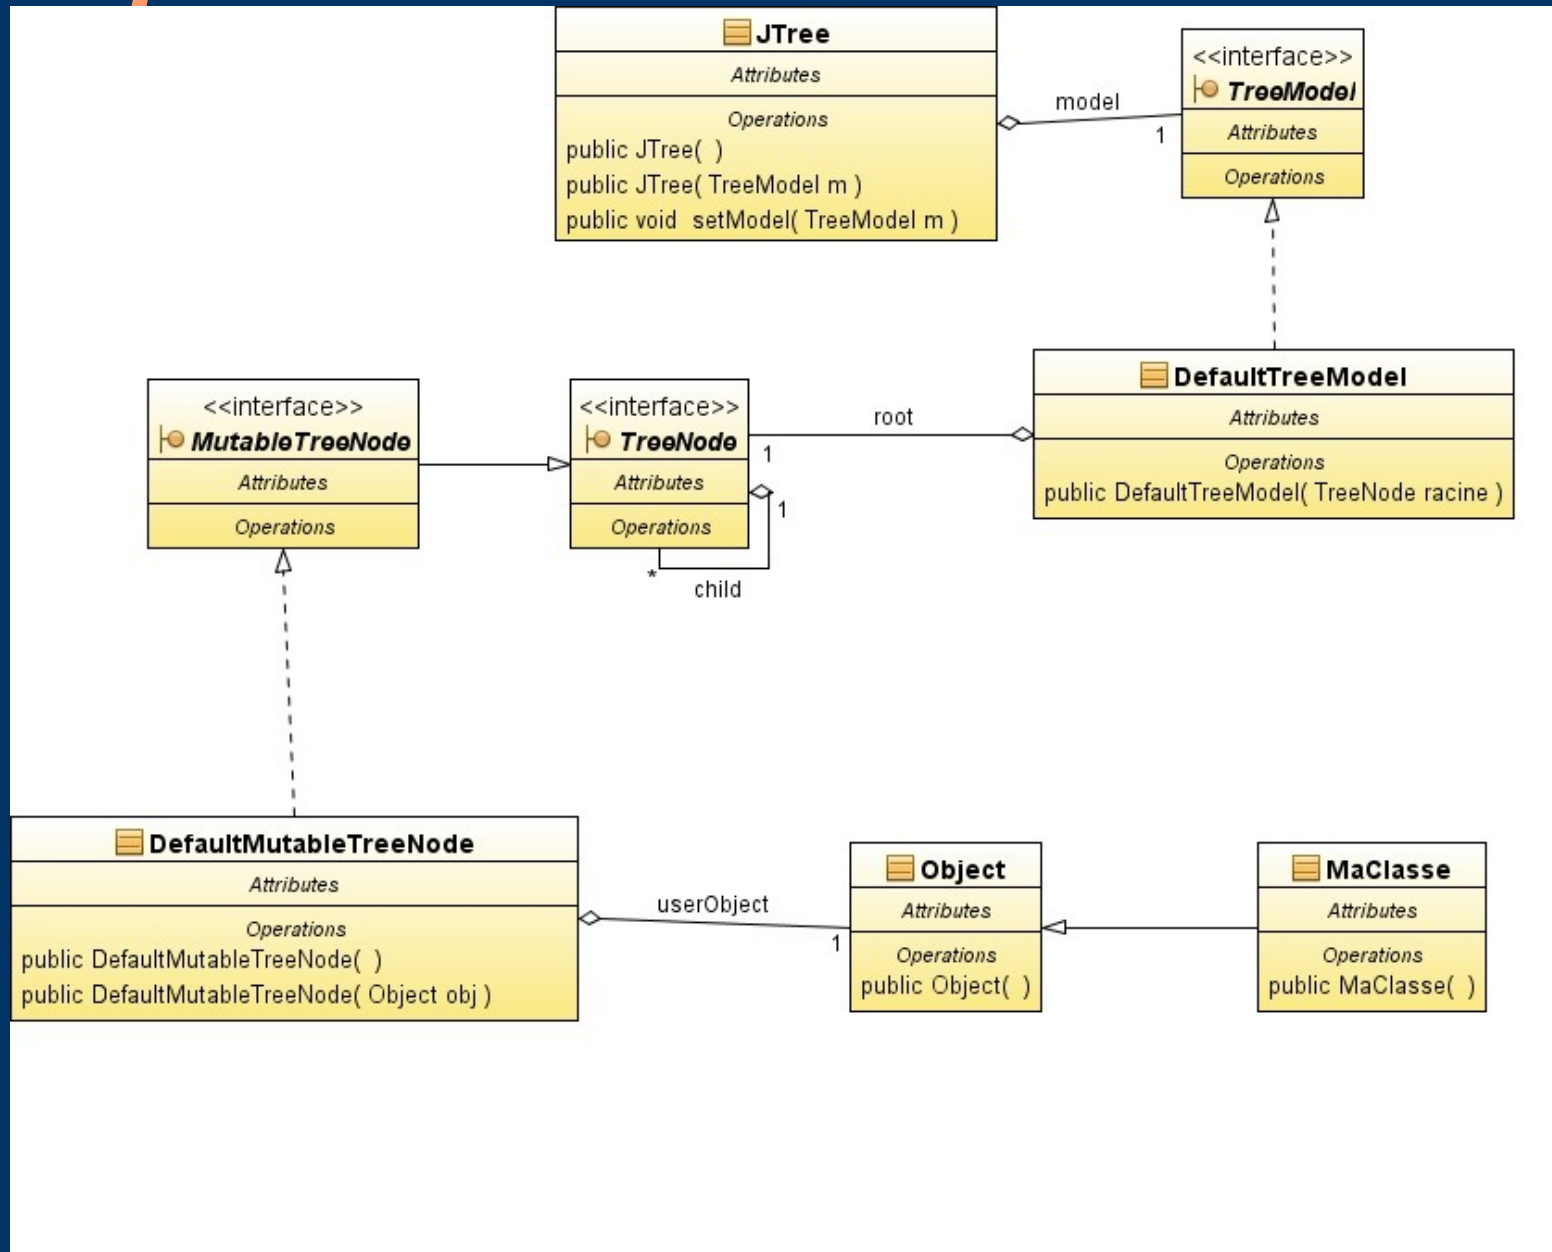

Modification de l'affichage

```
class affichage implements TreeCellRenderer {
    public Component getTreeCellRendererComponent(JTree tree, Object value, boolean selected,
        boolean expanded, boolean leaf, int row, boolean hasFocus) {
        //On ne va pas afficher d'icone mais mettre un "+" pour un noeud non-feuille non développé
        // et un "-" pour un noeud non-feuille développé. Les noeuds non-feuilles seront affichés en 16 points, les
        noeuds feuilles en 10 points. De plus, on va alterner les couleurs de fond.
        DefaultMutableTreeNode noeud = (DefaultMutableTreeNode) value;
        String contenu = (String) noeud.getUserObject();
        JLabel resultat = new JLabel();
        Font fonte1 = new Font("SansSerif", 0, 16); Font fonte2 = fonte1.deriveFont(0, 10);
        if (!leaf) {
            if (expanded) { contenu = "-" + contenu; } else { contenu = "+" + contenu; }
            resultat.setFont(fonte1);
        }
        else { resultat.setFont(fonte2); }
        if (selected) { resultat.setBackground(Color.YELLOW); }
        else {
            if (row % 2 == 0) { resultat.setBackground(Color.BLUE); }
            else { resultat.setBackground(Color.RED); }
        }
        resultat.setOpaque(true); resultat.setText(contenu);
        return resultat;
    }
}
```

JTree – Bilan

Classes pour une utilisation de base

JTree – Bilan

Obtension de l'objet sélectionné

Soit *arbre* le JTree :

```
TreePath tp = arbre.getSelectionPath();
```

```
DefaultMutableTreeNode noeud = (DefaultMutableTreeNode)  
    tp.getLastPathComponent();
```

```
MaClasse donnee = (MaClasse) noeud.getUserObject();
```

Remarques :

- `getLastPathComponent()` retourne un *Object*
 - `getUserObject()` retourne un *Object*
-
-

JTable : exemple

First Name	Last Name	Sport	# of Years	Vegetarian
Mary	Campione	Snowboarding	5	false
Alison	Huml	Rowing	3	true
Kathy	Walrath	Knitting	2	false
Sharon	Zakhour	Speed reading	20	true
Philip	Milne	Pool	10	false

Java Application Window

JTable : ajout dans un conteneur

- Pour un JScrollPane

```
JScrollPane scrollPane = new JScrollPane(table);  
table.setFillViewportHeight(true);
```

- Pour un autre conteneur

```
container.setLayout(new BorderLayout());  
container.add(table.getTableHeader(), BorderLayout.PAGE_START);  
container.add(table, BorderLayout.CENTER);
```

- Ainsi, les titres de colonne resteront toujours visible

JTable : cas de base

- Contraintes d'utilisation du cas de base
 - Tout est éditable sous la forme de chaîne de caractère
- Constructeurs :
 - `JTable(Object[][] données, Object[] nomsColonnes)`
 - `JTable(Vector données, Vector nomsColonnes)`
 - Données* est un vecteur de vecteurs d'objets

JTable : exemple du cas de base

```
import java.util.Vector;
import javax.swing.JFrame;
import javax.swing.JScrollPane;
import javax.swing.JTable;

public class Base extends JFrame {
    public Base() {
        super("table de base");
        // Intitulés des colonnes
        Vector<String> colonnes = new Vector<String>();
        colonnes.add("Nom"); colonnes.add("Prénom"); colonnes.add("Age");
        // Contenu de la table
        Vector<Vector<String>> donnees = new Vector<Vector<String>>();
        Vector<String> donnee1 = new Vector<String>();
        donnee1.add("fournier"); donnee1.add("domique"); donnee1.add("35"); donnees.add(donnee1);
        Vector<String> donnee2 = new Vector<String>();
        donnee2.add("amanton"); donnee2.add("laurent"); donnee2.add("20"); donnees.add(donnee2);
        // Création de la table
        JTable table = new JTable(donnees, colonnes);
        JScrollPane panneau; panneau = new JScrollPane(table);
        table.setFillViewportHeight(true);
        add(panneau);
        setDefaultCloseOperation(EXIT_ON_CLOSE); pack(); setVisible(true);
    }
    public static void main(String [] args) {
        Base fenetre = new Base();
    }
}
```

JTable : modèles sous-jacents

- Modèle des colonnes (TableColumnModel)
 - Interface TableColumnModel
 - Implantation de base : DefaultTableColumnModel
 - Modèle des données (TableModel)
 - Interface TableModel
 - Implantation de base : DefaultTableModel (sous-classe de AbstractTableModel)
 - Modèle de sélection (ListSelectionModel)
-
-

JTable : interface TableColumnModel

- **Modification des colonnes**
 - void addColumn(TableColumn col)
 - void removeColumn(TableColumn col)
 - void moveColumn(int columnIndex, int newIndex)
 - void setColumnMargin(int newMargin)
 - **Infos sur les colonnes**
 - int getColumnMargin()
 - Enumeration<TableColumn> getColumnns()
 - int getColumnCount()
 - int getColumnIndex(Object columnIdentifier)
 - int getColumnIndexAtX(int xPosition)
 - int getTotalColumnWidth()
 - TableColumn getColumn(int columnIndex)
 - **Sélection**
 - boolean getColumnSelectionAllowed()
 - int getSelectedColumnCount()
 - int[] getSelectedColumns()
 - ListSelectionModel getSelectionModel()
 - void setColumnSelectionAllowed(boolean flag)
 - void setSelectionModel(ListSelectionModel newModel)
 - **Ecouteurs**
 - void addColumnModelListener(TableColumnModelListener x)
 - void removeColumnModelListener(TableColumnModelListener x)
-
-

JTable : la classe TableColumn (1)

- Gère ce qui est propre à une colonne :
 - Sa largeur
 - Son intitulé
 - Les afficheurs (*renderer*) et éditeurs (*editor*) de ses données
 - Constructeurs
 - TableColumn()
 - TableColumn(int modelIndex)
 - modelIndex* : indice du champ des données associé à la colonne (quelle que soit la position de la colonne affichée)
 - TableColumn(int modelIndex, int width)
 - TableColumn(int modelIndex, int width, TableCellRenderer cellRenderer, TableCellEditor cellEditor)
-
-

JTable : la classe TableColumn (2)

Méthodes

- Void addPropertyChangeListener(PropertyChangeListener listener)
 - TableCellEditor getCellEditor()
 - TableCellRenderer getCellRenderer()
 - TableCellRenderer getHeaderRenderer()
 - Object getHeaderValue() / void setHeaderValue(Object headerValue)
 - Object getIdentifier() / void setIdentifier(Object identifier)
 - int getMaxWidth() / void setMaxWidth(int maxWidth)
 - int getMinWidth() / void setMinWidth(int minWidth)
 - int getModelIndex() / void setModelIndex(int modelIndex)
 - int getPreferredWidth() / void setPreferredWidth(int preferredWidth)
 - PropertyChangeListener[] getPropertyChangeListeners()
 - boolean getResizable()
 - int getWidth() / void setResizable(boolean isResizable)
 - void removePropertyChangeListener(PropertyChangeListener listener)
 - void setCellEditor(TableCellEditor cellEditor)
 - void setCellRenderer(TableCellRenderer cellRenderer)
 - void setHeaderRenderer(TableCellRenderer headerRenderer)
 - void sizeWidthToFit()
-
-

JTable : la classe TableColumnModelListener

- 5 méthodes
 - void columnAdded(TableColumnModelEvent e)
 - void columnMarginChanged(ChangeEvent e)
 - void columnMoved(TableColumnModelEvent e)
 - void columnRemoved(TableColumnModelEvent e)
 - void columnSelectionChanged(ListSelectionEvent e)

 - La classe TableColumnModelEvent
 - void columnAdded(TableColumnModelEvent e)
 - void columnMarginChanged(ChangeEvent e)
 - void columnMoved(TableColumnModelEvent e)
 - void columnRemoved(TableColumnModelEvent e)
 - void columnSelectionChanged(ListSelectionEvent e)
-
-

JTable : modèle des données

L'interface TableModel

- `void addTableModelListener(TableModelListener l)`
 - `Class<?> getColumnClass(int columnIndex)`
 - `int getColumnCount()`
 - `String getColumnName(int columnIndex)`
 - `int getRowCount()`
 - `Object getValueAt(int rowIndex, int columnIndex)`
 - `boolean isCellEditable(int rowIndex, int columnIndex)`
 - `void removeTableModelListener(TableModelListener l)`
 - `void setValueAt(Object aValue, int rowIndex, int columnIndex)`
-
-

JTable : la classe DefaultTableModel (1)

- Constructeurs

- DefaultTableModel() / DefaultTableModel(int rowCount, int columnCount)
- DefaultTableModel(Object[][] data, Object[] columnNames)
- DefaultTableModel(Object[] columnNames, int rowCount)
- DefaultTableModel(Vector columnNames, int rowCount)
- DefaultTableModel(Vector data, Vector columnNames)

- Méthodes de la classe AbstractTableModel

- void addTableModelListener(TableModelListener l)
 - int findColumn(String columnName)
 - void fireTableCellUpdated(int row, int column)
 - void fireTableChanged(TableModelEvent e)
 - void fireTableDataChanged()
 - void fireTableRowsDeleted(int firstRow, int lastRow)
 - void fireTableRowsInserted(int firstRow, int lastRow)
 - void fireTableRowsUpdated(int firstRow, int lastRow)
 - void fireTableStructureChanged()
 - Class<?> getColumnClass(int columnIndex)
 - String getColumnName(int column)
 - <T extends EventListener> T[] getListeners(Class<T> listenerType)
 - TableModelListener[] getTableModelListeners()
 - void removeTableModelListener(TableModelListener l)
 - void setValueAt(Object aValue, int rowIndex, int columnIndex)
-
-

JTable : la classe DefaultTableModel (2)

- Méthodes

- void addColumn(Object columnName) / void addColumn(Object columnName, Object[] columnData) / void addColumn(Object columnName, Vector columnData)
 - void addRow(Object[] rowData) / void addRow(Vector rowData)
 - void insertRow(int row, Object[] rowData) / void insertRow(int row, Vector rowData)
 - void removeRow(int row)
 - void moveRow(int start, int end, int to)
 - int getColumnCount() / void setColumnCount(int columnCount)
 - int getRowCount() / void setNumRows(int rowCount) / void setRowCount(int rowCount)
 - String getColumnName(int column)
 - Vector getDataVector() / void setDataVector(Object[][] dataVector, Object[] columnIdentifiers) / void setDataVector(Vector dataVector, Vector columnIdentifiers)
 - Object getValueAt(int row, int column) / void setValueAt(Object aValue, int row, int column)
 - boolean isCellEditable(int row, int column)
 - void newDataAvailable(TableModelEvent event) / void newRowsAdded(TableModelEvent e) / void rowsRemoved(TableModelEvent event)
 - void setColumnIdentifiers(Object[] newIdentifiers) / void setColumnIdentifiers(Vector columnIdentifiers)
-
-

JTable : la classe TableModelListener

- 1 méthode

```
void tableChanged(TableModelEvent e)
```

- La classe TableModelEvent

- int getColumn()
- int getFirstRow()
- int getLastRow()
- int getType()

type d'événement : INSERT, UPDATE and DELETE.

La classe JTable : Constructeurs

- JTable()
 - JTable(int numRows, int numColumns)
 - JTable(Object[][] rowData, Object[] columnNames)
 - JTable(TableModel dm)
 - JTable(TableModel dm, TableColumnModel cm)
 - JTable(TableModel dm, TableColumnModel cm, ListSelectionModel sm)
 - JTable(Vector rowData, Vector columnNames)
-
-

Méthodes de *JTable* : données

- Modèle des données
 - `TableModel getModel()`
 - `void setModel(TableModel dataModel)`
 - Données
 - `Object getValueAt(int row, int column)`
 - `void setValueAt(Object aValue, int row, int column)`
 - `int getRowCount()`
 - Colonnes
 - `void removeColumn(TableColumn aColumn)`
 - `void setAutoCreateColumnsFromModel(boolean autoCreateColumnsFromModel)`
 - `void moveColumn(int column, int targetColumn)`
 - `void addColumn(TableColumn aColumn)`
 - `void createDefaultColumnsFromModel()`
 - `boolean getAutoCreateColumnsFromModel()`
 - `TableColumn getColumn(Object identifier)`
 - `int getColumnCount()`
 - `String getColumnName(int column)`
 - `Class<?> getColumnClass(int column)`
 - Modèle des colonnes
 - `TableColumnModel getColumnModel()`
 - `void setColumnModel(TableColumnModel columnModel)`
-
-

Méthodes de JTable : mise en forme (1)

- Conversion des indices affichage/données
 - int convertColumnIndexToModel(int viewColumnIndex)
 - int convertColumnIndexToView(int modelColumnIndex)
 - int convertRowIndexToModel(int viewRowIndex)
 - int convertRowIndexToView(int modelRowIndex)
 - Grille
 - Color getGridColor() / void setGridColor(Color gridColor)
 - boolean getShowHorizontalLines() / void setShowHorizontalLines(boolean b)
 - boolean getShowVerticalLines() / void setShowVerticalLines(boolean b)
 - void setShowGrid(boolean showGrid)
 - Tailles variées
 - int getRowHeight() / void setRowHeight(int rowHeight)
 - int getRowHeight(int row) / void setRowHeight(int row, int rowHeight)
 - int getRowMargin() / void setRowMargin(int rowMargin)
 - Dimension getInterCellSpacing()
 - void setInterCellSpacing(Dimension intercellSpacing)
-
-

Méthodes de JTable : mise en forme (2)

- Défilement
 - int getScrollableBlockIncrement(Rectangle visibleRect, int orientation, int direction)
 - boolean getScrollableTracksViewportHeight()
 - boolean getScrollableTracksViewportWidth()
 - Dimension getPreferredScrollableViewportSize()
 - void setPreferredScrollableViewportSize(Dimension size)
 - int getScrollableUnitIncrement(Rectangle visibleRect, int orientation, int direction)
 - UI
 - TableUI getUI() / void setUI(TableUI ui) / void updateUI() / String getUIClassID()
 - En-tête
 - JTableHeader getTableHeader() / void setTableHeader(JTableHeader tableHeader)
 - Autre
 - int getAutoResizeMode() / void setAutoResizeMode(int mode)
 - boolean getFillsViewportHeight() / void setFillsViewportHeight(boolean b)
 - boolean getSurrendersFocusOnKeystroke()
 - void setSurrendersFocusOnKeystroke(boolean b)
 - String getToolTipText(MouseEvent event)
-
-

Méthodes de JTable : divers

- Edition

- boolean editCellAt(int row, int column)
- boolean editCellAt(int row, int column, EventObject e)
- int getEditingColumn() / void setEditingColumn(int aColumn)
- int getEditingRow() / void setEditingRow(int aRow)
- boolean isCellEditable(int row, int column)
- boolean isEditing()

- Tri

- boolean getAutoCreateRowSorter()
- RowSorter<? extends TableModel> getRowSorter()
- void setAutoCreateRowSorter(boolean autoCreateRowSorter)
- void setRowSorter(RowSorter<? extends TableModel> sorter)

- Coordonnées

- Rectangle getCellRect(int row, int column, boolean includeSpacing)
 - int columnAtPoint(Point point) / int rowAtPoint(Point point)
-
-

Méthodes de *JTable* : éditeurs/afficheurs

- Éditeurs

- TableCellEditor getCellEditor()
- TableCellEditor getCellEditor(int row, int column)
- TableCellEditor getDefaultEditor(Class<?> columnClass)
- Component prepareEditor(TableCellEditor editor, int row, int column)
- void setDefaultEditor(Class<?> columnClass, TableCellEditor editor)
- void setCellEditor(TableCellEditor anEditor)
- void removeEditor()
- Component getEditorComponent()

- Afficheurs

- void createDefaultRenderers()
 - TableCellRenderer getCellRenderer(int row, int column)
 - TableCellRenderer getDefaultRenderer(Class<?> columnClass)
 - Component prepareRenderer(TableCellRenderer renderer, int row, int column)
 - void setDefaultRenderer(Class<?> columnClass, TableCellRenderer renderer)
-
-

Méthodes de JTable : sélection (1)

- Général

- void clearSelection() / void selectAll()
- boolean getCellSelectionEnabled() / void setCellSelectionEnabled(boolean b)
- Color getSelectionBackground() / void setSelectionBackground(Color col)
- Color getSelectionForeground() / void setSelectionForeground(Color col)
- boolean isSelected(int row, int column)
- void setSelectionMode(int selectionMode)

- Colonnes

- void addColumnSelectionInterval(int index0, int index1)
 - boolean getColumnSelectionAllowed() / void setColumnSelectionAllowed(boolean b)
 - int getSelectedColumn() / int[] getSelectedColumns()
 - boolean isColumnSelected(int col)
 - int getSelectedColumnCount()
 - void removeColumnSelectionInterval(int index0, int index1)
 - void setColumnSelectionInterval(int index0, int index1)
-
-

Méthodes de JTable : sélection (2)

- Lignes
 - void addRowSelectionInterval(int index0, int index1)
 - void removeRowSelectionInterval(int index0, int index1)
 - void setRowSelectionInterval(int index0, int index1)
 - void changeSelection(int rowIndex, int columnIndex, boolean toggle, boolean extend)
 - int getSelectedRow() / int[] getSelectedRows()
 - boolean isRowSelected(int row)
 - int getSelectedRowCount()
 - ListSelectionModel getSelectionModel() /void setSelectionModel(ListSelectionModel M)
 - boolean getRowSelectionAllowed() / void setRowSelectionAllowed(boolean b)
 - void setUpdateSelectionOnSort(boolean b) / boolean getUpdateSelectionOnSort()
-
-

Méthodes de JTable : événements

- Interfaces notamment implémentées par JTable :
 - TableModelListener
 - TableColumnModelListener
 - ListSelectionListener
 - CellEditorListener
 - RowSorterListener
 - Méthodes associées :
 - void columnAdded(TableColumnModelEvent e)
 - void columnMarginChanged(ChangeEvent e)
 - void columnMoved(TableColumnModelEvent e)
 - void columnRemoved(TableColumnModelEvent e)
 - void columnSelectionChanged(ListSelectionEvent e)
 - void editingCanceled(ChangeEvent e)
 - void editingStopped(ChangeEvent e)
 - void tableChanged(TableModelEvent e)
 - void valueChanged(ListSelectionEvent e)
 - void sorterChanged(RowSorterEvent e)
-
-

Tri de lignes

RowSorter<M>

DefaultRowSorter<M,I>

I = Integer

TableRowSorter<M extends TableModel>
